

Wildlife Cam — Quick Card

Keep this handy — everything you need to start working with the AI helper.

The project

A small **outdoor wildlife camera**: it takes photos/video, saves them to a memory card, and can stream a live view to your phone over long-range Wi-Fi.

Talking to the AI helper

- **Big or fuzzy task** → it asks you **~3 quick questions** first, so it builds the *right* thing. (On purpose — answer them.)
- **Small or clear task** → it just does it.
- It always finishes with a short, plain-English **"In plain words"** recap.

Skip the questions — escape hatch

Don't want the 3 questions for one request? Include any of these in your message:

just do it

skip the questions

no questions

quick:

--quick

Applies to **that one message only** — the next big task turns the questions back on. You'll still get the plain-English recap.

Two habits that save hours

- **Change ONE thing at a time** when something breaks, and keep notes.
- **A "stuck" board or memory card?** Fully **unplug the USB for ~5 seconds** — a reset button is *not* enough (like force-restarting a frozen phone).
